

VERSATILITY THROUGH CONNECTIVITY

Wright's Proprietary Modular Subsea Connector gets an official seal of approval

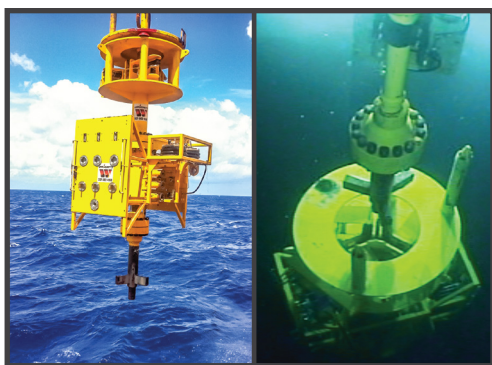

Houston, Texas – Wright's Well Control Services was recently issued a patent for its' Propriety Modular Subsea Connector.

The innovative assembly is composed of a male (stab) and female (receptacle) components allowing the ability to mix and match systems as dictated by project requirements during various operational phases. This allows Wright's to perform rigless operations from a variety of vessels.

This system allows components to be stacked in various combinations so that only pre-determined systems are installed or retrieved during operations as needed, eliminating the need to retrieval an entire system for maintenance or modifications. Test stands are provided thus allowing testing of critical components prior to installation. System interface is accomplished via an ROV hot stab that engages or disengages hydraulic locking pins.

Rigless intervention is recognized as a viable option during the current downturn when cost and cost savings is the prime driver in today's market. Wright's developed this innovative, modular based connector to add a layer of versatility to offshore operations, while lowering the operational cost due to tripping and handling of equipment to a minimum.

Connectivity Examples

KEY SPECS

- API flange interface
- 15K rated working pressure
- Pull tested to 89,000lbs
- Full thru bore
- Can be designed to client's specifications

Patent No.: US 9,228,416 B2

Wright's Well Control Services provides cost effective and innovative oil and gas well solutions that put safety, health and the environment first. Wright's engineers and executes numerous first-to-market services and has become a definitive source for customized solutions for the most challenging offshore environments in the Gulf of Mexico (GOM) and beyond. It is Wright's' core values – Safety, Integrity, Collaboration, Innovation and Quality that drive the Wright's team to be leaders in innovative sustainable solutions. Wright's was founded in 2006 by David Wright and has over 25 years of offshore and onshore engineering experience including work at Halliburton, The Red Adair Company, and ATP. Wright's is a privately held company with corporate offices in Houston, Texas and an operations facility in Lake Charles, Louisiana.
